NEW AMIDINO BENZYLAMINE DERIVATIVES AND THEIR USE AS THROMBIN INHIBITORS

Field of the Invention

5

This invention relates to novel pharmaceutically useful compounds, in particular compounds that are, or are prodrugs of, competitive inhibitors of trypsin-like serine proteases, especially thrombin, their use as medicaments, pharmaceutical compositions containing them and synthetic
10 routes to their production.

Background

Blood coagulation is the key process involved in both haemostasis (i.e. the
15 prevention of blood loss from a damaged vessel) and thrombosis (i.e. the formation of a blood clot in a blood vessel, sometimes leading to vessel obstruction).

Coagulation is the result of a complex series of enzymatic reactions. One
20 of the ultimate steps in this series of reactions is the conversion of the proenzyme prothrombin to the active enzyme thrombin.

Thrombin is known to play a central role in coagulation. It activates platelets, leading to platelet aggregation, converts fibrinogen into fibrin
25 monomers, which polymerise spontaneously into fibrin polymers, and activates factor XIII, which in turn crosslinks the polymers to form insoluble fibrin. Furthermore, thrombin activates factor V and factor VIII leading to a "positive feedback" generation of thrombin from prothrombin.

By inhibiting the aggregation of platelets and the formation and crosslinking of fibrin, effective inhibitors of thrombin would be expected to exhibit antithrombotic activity. In addition, antithrombotic activity would be expected to be enhanced by effective inhibition of the positive
5 feedback mechanism.

Further, it is known that administration of prodrugs of thrombin inhibitors may give rise to improvements in:

- (a) certain pharmacokinetic properties after administration of; and
- 10 (b) the prevalence of certain side effects associated with, those inhibitors.

Prior Art

15 The early development of low molecular weight inhibitors of thrombin has been described by Claesson in Blood Coagul. Fibrinol. (1994) 5, 411.

Blombäck *et al* (in J. Clin. Lab. Invest. 24, suppl. 107, 59, (1969)) reported thrombin inhibitors based on the amino acid sequence situated
20 around the cleavage site for the fibrinogen A α chain. Of the amino acid sequences discussed, these authors suggested the tripeptide sequence Phe-Val-Arg (P9-P2-P1, hereinafter referred to as the P3-P2-P1 sequence) would be the most effective inhibitor.

25 Thrombin inhibitors based on dipeptidyl derivatives with an α,ω -aminoalkyl guanidine in the P1-position are known from US Patent N $^{\circ}$ 4,346,078 and International Patent Application WO 93/11152. Similar, structurally related, dipeptidyl derivatives have also been reported. For example International Patent Application WO 94/29336 discloses

compounds with, for example, aminomethyl benzamidines, cyclic aminoalkyl amidines and cyclic aminoalkyl guanidines in the P1-position (International Patent Application WO 97/23499 discloses prodrugs of certain of these compounds); European Patent Application 0 648 780,
5 discloses compounds with, for example, cyclic aminoalkyl guanidines in the P1-position.

Thrombin inhibitors based on peptidyl derivatives, also having cyclic aminoalkyl guanidines (e.g. either 3- or 4- aminomethyl-1-amidino-
10 piperidine) in the P1-position are known from European Patent Applications 0 468 231, 0 559 046 and 0 641 779.

Thrombin inhibitors based on tripeptidyl derivatives with arginine aldehyde in the P1-position were first disclosed in European Patent
15 Application 0 185 390.

More recently, arginine aldehyde-based peptidyl derivatives, modified in the P3-position, have been reported. For example, International Patent Application WO 93/18060 discloses hydroxy acids, European Patent
20 Application 0 526 877 des-amino acids, and European Patent Application 0 542 525 O-methyl mandelic acids in the P3-position.

Inhibitors of serine proteases (e.g. thrombin) based on electrophilic ketones in the P1-position are also known. For example, European Patent
25 Application 0 195 212 discloses peptidyl α -keto esters and amides, European Patent Application 0 362 002 fluoroalkylamide ketones, European Patent Application 0 364 344 α,β,δ -triketocompounds, and European Patent Application 0 530 167 α -alkoxy ketone derivatives of arginine in the P1-position.

Other, structurally different, inhibitors of trypsin-like serine proteases based on C-terminal boronic acid derivatives of arginine and isothiuronium analogues thereof are known from European Patent
5 Application 0 293 881.

More recently, thrombin inhibitors based on peptidyl derivatives have been disclosed in European Patent Application 0 669 317 and International Patent Applications WO 95/35309, WO 95/23609, WO 96/25426, WO
10 97/02284, WO 97/46577, WO 96/32110, WO 96/31504, WO 96/03374, WO 98/06740 and WO 97/49404.

However, there remains a need for effective inhibitors of trypsin-like serine proteases, such as thrombin. There is also a need for compounds
15 which are both orally bioavailable and selective in inhibiting thrombin over other serine proteases, in particular those involved in haemostasis. Compounds which exhibit competitive inhibitory activity towards thrombin would be expected to be especially useful as anticoagulants and therefore in the therapeutic treatment of thrombosis and related disorders.

The enantiomeric forms of compounds of formula II (i.e. those compounds having different configurations of substituents about the C-atom α- to the CO₂H group) may be separated by an enantiospecific derivatisation step. This may be achieved, for example by an enzymatic process. Such enzymatic processes include, for example, transesterification of the α-OH group at between room and reflux temperature (e.g. at between 45 and 55°C) in the presence of a suitable enzyme (e.g. Lipase PS Amano), an appropriate ester (e.g. vinyl acetate) and a suitable solvent (e.g. methyl *tert*-butyl ether). The derivatised isomer may then be separated from the unreacted isomer by conventional separation techniques (e.g. chromatography).

20
25

Groups added to compounds of formula II in such a derivatisation step may be removed either before any further reactions or at any later stage in the synthesis of compounds of formula I. The additional groups may be removed using conventional techniques (e.g. for esters of the α -OH group, hydrolysis under conditions known to those skilled in the art (e.g. at between room and reflux temperature in the presence of a suitable base (e.g. NaOH) and an appropriate solvent (e.g. MeOH, water or mixtures thereof))).

10 Compounds of formula III may be prepared by reaction of a compound of formula XIII

XIII

wherein Y is as hereinbefore defined with a compound of formula V as hereinbefore defined, for example under conditions such as those described hereinbefore for synthesis of compounds of formula I (see, for example, process steps (i) and (ii)).

Compounds of formula IV are readily available using known techniques. For example, compounds of formula IV may be prepared by reaction of a compound of formula II as hereinbefore defined with a compound of formula XIII as hereinbefore defined, for example under conditions such as those described hereinbefore for synthesis of compounds of formula I (see, for example, process steps (i) and (ii)).

Compounds of formula V are known in the literature, and/or may be prepared using known techniques. For example compounds of formula V may be prepared by reduction of a compound of formula XIV,

- 5 wherein R^3 and R^4 are as hereinbefore defined, under conditions that are well known to those skilled in the art.

Compounds of formula VI may be prepared in accordance with peptide coupling techniques, for example in analogous fashion to the methods
 10 described hereinbefore for compounds of formula I (see, for example, process steps (i) and (ii)). If desired, compounds of formula VIII may also be prepared in this way.

Compounds of formula IXB may be prepared by reaction of a
 15 corresponding compound of formula I in which R^4 represents H with an excess of a compound of formula IVA,

wherein R^{10a} and R^{10b} are as hereinbefore defined, for example under conditions known to those skilled in the art.

20

Compounds of formula X are commercially available, are well known in the literature, or are available using known and/or standard techniques.

For example, compounds of formula X may be prepared by reduction of a
 25 compound of formula XV,

wherein R^1 and R^2 are as hereinbefore defined, in the presence of a suitable reducing agent (e.g. DIBAL-H).

- 5 Alternatively, compounds of formula X may be prepared by oxidation of a compound of formula XVI,

wherein R^1 and R^2 are as hereinbefore defined, in the presence of a suitable oxidising agent (e.g. pyridinium chlorochromate or a combination
10 of DMSO and oxalyl chloride).

Compounds of formulae II, IV, VI, VIII, X, XV and XVI in which R^1 includes a $S(O)$ or a $S(O)_2$ group, may be prepared by oxidation of a corresponding compound of formula II, IV, VI, VIII, X, XV or XVI (as
15 appropriate) wherein R^1 includes a S group, for example as described hereinbefore.

Compounds of formulae VII, IX, IXA, IXC, IXD, XI, XII, XIII, XIV, XIVA, XV and XVI, and derivatives thereof, are either commercially
20 available, are known in the literature, or may be obtained either by analogy with the processes described herein, or by conventional synthetic

procedures, in accordance with standard techniques, from readily available starting materials using appropriate reagents and reaction conditions (e.g. as described hereinafter).

- 5 Substituents on the aromatic and/or non-aromatic, carbocyclic and heterocyclic ring(s) in compounds of formulae I, II, III, IV, V, VI, VII, VIII, IX, IXA, IXB, IXC, IXD, X, XIII, XIV, XV and XVI may be introduced and/or interconverted using techniques well known to those skilled in the art. For example, nitro may be reduced to amino, amino
10 may be alkylated or acylated to give alkyl- and/or acylamino, amino may be converted to pyrrolo (by condensation with a 2,5-dimethoxytetrahydrofuran in the presence of a catalyst, such as phosphorous pentoxide), amino may be converted (*via* diazotisation) to halo or (e.g. *via* reaction with a 1,4- or 1,5-dihaloalkyl compound or a β - or γ -haloester) to a nitrogen-
15 containing ring (optionally substituted with a =O group), iodo may be converted to nitrogen-containing heterocycles (for example imidazolyl and piperidiny, by treatment with imidazole or piperidine under Buchwald conditions), nitrogen hydroxy may be alkylated to give alkoxy, alkoxy may be hydrolysed to hydroxy, alkenes may be hydrogenated to alkanes,
20 halo may be hydrogenated to H, etc. In this regard, compounds of formula XV in which R^1 represents $-N(CH_3)_2$ and R^2 represent chloro or methyl, may be obtained from commercially available iodo-chloro or iodo-methyl disubstituted benzoic acid methyl esters using Pd-catalysed amination, for example as described by Wolfe *et al* in *Tetrahedron Lett.*
25 38, 6367 (1997), followed by either reductive amination (for example using HCHO and a reducing agent such as $Na(CN)BH_3$ or a combination of Pt(IV) oxide and hydrogen), or alkylation (for example using MeI and an appropriate base), of the resultant aniline. Compounds of formula XV in which R^1 represents $-S(O)_mCH_3$ (in which m is as hereinbefore defined)

and R² represents chloro or methyl, may be obtained from the resultant aniline described above (or from the corresponding benzoic acid) *via* diazotisation, followed by treatment of the diazonium salt with potassium ethyl xanthate, and then hydrolysis of the intermediate to give the
5 corresponding thiophenol, for example as described by Tarbell *et al* in "Organic Synthesis", Coll. Vol. III, p 809-11 (1955). The resultant thiophenol may then be alkylated (for example using an appropriate alkyl iodide in the presence of a suitable base in EtOH), and then (if necessary) oxidised to form the sulfone or sulfoxide (for example using *m*CPBA in
10 CH₂Cl₂ or potassium peroxymonosulfate in methanol/water).

The compounds of formula I may be isolated from their reaction mixtures using conventional techniques.

15 It will be appreciated by those skilled in the art that in the processes described above the functional groups of intermediate compounds may need to be protected by protecting groups.

Functional groups which it is desirable to protect include hydroxy, amino,
20 aldehyde, 2-hydroxycarboxylic acid and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl or diarylalkylsilyl groups (e.g. *t*-butyldimethylsilyl, *t*-butyldiphenylsilyl or trimethylsilyl) and tetrahydropyranyl. Suitable protecting groups for carboxylic acid include C₁₋₆ alkyl or benzyl esters. Suitable protecting groups for amino
25 and amidino include *t*-butyloxycarbonyl, benzyloxycarbonyl or 2-trimethylsilylethoxycarbonyl (Teoc). Amidino nitrogens may also be protected by hydroxy or alkoxy groups, and may be either mono- or diprotected. Aldehydes may be protected as acetals by reacting with e.g.

ethylene glycol. 2-Hydroxy carboxylic acids may be protected by condensing with e.g. acetone.

The protection and deprotection of functional groups may take place
5 before or after coupling, or before or after any other reaction in the abovementioned schemes.

Protecting groups may be removed in accordance with techniques which are well known to those skilled in the art and as described hereinafter.

10

Persons skilled in the art will appreciate that, in order to obtain compounds of formula I in an alternative, and, on some occasions, more convenient, manner, the individual process steps mentioned hereinbefore may be performed in a different order, and/or the individual reactions may
15 be performed at a different stage in the overall route (i.e. substituents may be added to and/or chemical transformations performed upon, different intermediates to those mentioned hereinbefore in conjunction with a particular reaction). This may negate, or render necessary, the need for protecting groups.

20

For example, this is particularly true in respect of the synthesis of compounds of formula I in which R^4 does not represent H. In this case, OH, OR^{8a} , $C(O)OR^{8b}$ and/or R^{8c} groups may be introduced at an earlier stage in the overall synthesis using the process steps described
25 hereinbefore (see, for example, process steps (iii) to (viii)). Further, the mandelic acid OH group of compounds of formulae II and IV may need to be protected prior to the coupling steps described above.

Accordingly, the order and type of chemistry involved will dictate the need, and type, of protecting groups as well as the sequence for accomplishing the synthesis.

- 5 The use of protecting groups is fully described in "Protective Groups in Organic Chemistry", edited by J W F McOmie, Plenum Press (1973), and "Protective Groups in Organic Synthesis", 2nd edition, T W Greene & P G M Wutz, Wiley-Interscience (1991).
- 10 Protected derivatives of compounds of formula I may be converted chemically to compounds of formula I using standard deprotection techniques (e.g. hydrogenation). The skilled person will also appreciate that certain compounds of formula I may also be referred to as being "protected derivatives" of other compounds of formula I.

15

Medical and pharmaceutical use

- Compounds of the invention may possess pharmacological activity as such. Compounds of the invention that may possess such activity include,
- 20 but are not limited to, those in which R^4 is H.

- However, other compounds of formula I (including those in which R^4 is not H) may not possess such activity, but may be administered parenterally or orally, and thereafter metabolised in the body to form
- 25 compounds that are pharmacologically active (including, but not limited to, corresponding compounds in which R^4 is H). Such compounds (which also includes compounds that may possess some pharmacological activity, but that activity is appreciably lower than that of the "active" compounds

to which they are metabolised), may therefore be described as “prodrugs” of the active compounds.

Thus, the compounds of the invention are useful because they possess
5 pharmacological activity, and/or are metabolised in the body following oral or parenteral administration to form compounds which possess pharmacological activity. The compounds of the invention are therefore indicated as pharmaceuticals.

10 According to a further aspect of the invention there is thus provided the compounds of the invention for use as pharmaceuticals.

In particular, compounds of the invention are potent inhibitors of thrombin either as such and/or (e.g. in the case of prodrugs), are metabolised
15 following administration to form potent inhibitors of thrombin, for example as demonstrated in the tests described below.

By “prodrug of a thrombin inhibitor”, we include compounds that form a thrombin inhibitor, in an experimentally-detectable amount, and within a
20 predetermined time (e.g. about 1 hour), following oral or parenteral administration.

The compounds of the invention are thus expected to be useful in those conditions where inhibition of thrombin is required.

25

The compounds of the invention are thus indicated in the treatment and/or prophylaxis of thrombosis and hypercoagulability in blood and tissues of animals including man.

It is known that hypercoagulability may lead to thrombo-embolic diseases. Conditions associated with hypercoagulability and thrombo-embolic diseases which may be mentioned include inherited or acquired activated protein C resistance, such as the factor V-mutation (factor V Leiden), and
5 inherited or acquired deficiencies in antithrombin III, protein C, protein S or heparin cofactor II. Other conditions known to be associated with hypercoagulability and thrombo-embolic disease include circulating antiphospholipid antibodies (Lupus anticoagulant), homocysteinemi, heparin induced thrombocytopenia and defects in fibrinolysis. The
10 compounds of the invention are thus indicated both in the therapeutic and/or prophylactic treatment of these conditions.

The compounds of the invention are further indicated in the treatment of conditions where there is an undesirable excess of thrombin without signs
15 of hypercoagulability, for example in neurodegenerative diseases such as Alzheimer's disease.

Particular disease states which may be mentioned include the therapeutic and/or prophylactic treatment of venous thrombosis and pulmonary
20 embolism, arterial thrombosis (e.g. in myocardial infarction, unstable angina, thrombosis-based stroke and peripheral arterial thrombosis) and systemic embolism usually from the atrium during arterial fibrillation or from the left ventricle after transmural myocardial infarction.

25 Moreover, the compounds of the invention are expected to have utility in prophylaxis of re-occlusion (i.e. thrombosis) after thrombolysis, percutaneous trans-luminal angioplasty (PTA) and coronary bypass operations; the prevention of re-thrombosis after microsurgery and vascular surgery in general.

Further indications include the therapeutic and/or prophylactic treatment of disseminated intravascular coagulation caused by bacteria, multiple trauma, intoxication or any other mechanism; anticoagulant treatment when blood is in contact with foreign surfaces in the body such as vascular grafts, vascular stents, vascular catheters, mechanical and biological prosthetic valves or any other medical device; and anticoagulant treatment when blood is in contact with medical devices outside the body such as during cardiovascular surgery using a heart-lung machine or in haemodialysis.

10

In addition to its effects on the coagulation process, thrombin is known to activate a large number of cells (such as neutrophils, fibroblasts, endothelial cells and smooth muscle cells). Therefore, the compounds of the invention may also be useful for the therapeutic and/or prophylactic treatment of idiopathic and adult respiratory distress syndrome, pulmonary fibrosis following treatment with radiation or chemotherapy, septic shock, septicemia, inflammatory responses, which include, but are not limited to, edema, acute or chronic atherosclerosis such as coronary arterial disease, cerebral arterial disease, peripheral arterial disease, reperfusion damage, and restenosis after percutaneous trans-luminal angioplasty (PTA).

20

Compounds of the invention that inhibit trypsin and/or thrombin may also be useful in the treatment of pancreatitis.

According to a further aspect of the present invention, there is provided a method of treatment of a condition where inhibition of thrombin is required which method comprises administration of a therapeutically effective amount of a compound of the invention, or a pharmaceutically

25

acceptable salt thereof, to a person suffering from, or susceptible to such a condition.

The compounds of the invention will normally be administered orally,
5 intravenously, subcutaneously, buccally, rectally, dermally, nasally, tracheally, bronchially, by any other parenteral route or *via* inhalation, in the form of pharmaceutical preparations comprising active compound either as a free base, or a pharmaceutically acceptable non-toxic organic or inorganic acid addition salt, in a pharmaceutically acceptable dosage
10 form. Depending upon the disorder and patient to be treated and the route of administration, the compositions may be administered at varying doses.

The compounds of the invention may also be combined and/or co-administered with any antithrombotic agent with a different mechanism of
15 action, such as the antiplatelet agents acetylsalicylic acid, ticlopidine, clopidogrel, thromboxane receptor and/or synthetase inhibitors, fibrinogen receptor antagonists, prostacyclin mimetics and phosphodiesterase inhibitors and ADP-receptor (P_2T) antagonists.

20 The compounds of the invention may further be combined and/or co-administered with thrombolytics such as tissue plasminogen activator (natural, recombinant or modified), streptokinase, urokinase, prourokinase, anisoylated plasminogen-streptokinase activator complex (APSAC), animal salivary gland plasminogen activators, and the like, in
25 the treatment of thrombotic diseases, in particular myocardial infarction.

According to a further aspect of the invention there is thus provided a pharmaceutical formulation including a compound of the invention, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier.

Suitable daily doses of the compounds of the invention in therapeutical treatment of humans are about 0.001-100 mg/kg body weight at peroral administration and 0.001-50 mg/kg body weight at parenteral administration.

5

The compounds of the invention have the advantage that they may, or may be metabolised to compounds that may, be more efficacious, be less toxic, be longer acting, have a broader range of activity, be more potent, produce fewer side effects, be more easily absorbed than, or have other
10 useful pharmacological, physical, or chemical, properties over, compounds known in the prior art.

Biological Tests

15 Test A

Determination of Thrombin Clotting Time (TT)

The inhibitor solution (25 µL) was incubated with plasma (25 µL) for three minutes. Human thrombin (T 6769; Sigma Chem. Co or Hematologic Technologies) in buffer solution, pH 7.4 (25 µL, 4.0 NIH
20 units/mL), was then added and the clotting time measured in an automatic device (KC 10; Amelung).

The thrombin clotting time (TT) is expressed as absolute values (seconds) as well as the ratio of TT without inhibitor (TT₀) to TT with inhibitor
25 (TT_i). The latter ratios (range 1-0) were plotted against the concentration of inhibitor (log transformed) and fitted to sigmoidal dose-response curves according to the equation

$$y = a/[1 + (x/IC_{50})^s]$$

where: a = maximum range, i.e. 1; s = slope of the dose-response curve;
and IC_{50} = the concentration of inhibitor that doubles the clotting time.
The calculations were processed on a PC using the software program
GraFit Version 3, setting equation equal to: Start at 0, define end = 1
5 (Erithacus Software, Robin Leatherbarrow, Imperial College of Science,
London, UK).

Test B

Determination of Thrombin Inhibition with a Chromogenic, Robotic Assay

10 The thrombin inhibitor potency was measured with a chromogenic
substrate method, in a Plato 3300 robotic microplate processor (Rosys
AG, CH-8634 Hombrechtikon, Switzerland), using 96-well, half volume
microtitre plates (Costar, Cambridge, MA, USA; Cat No 3690). Stock
solutions of test substance in DMSO (72 μ L), 0.1 - 1 mmol/L, were
15 diluted serially 1:3 (24 + 48 μ L) with DMSO to obtain ten different
concentrations, which were analysed as samples in the assay. 2 μ L of test
sample was diluted with 124 μ L assay buffer, 12 μ L of chromogenic
substrate solution (S-2366, Chromogenix, Mölndal, Sweden) in assay
buffer and finally 12 μ L of α -thrombin solution (Human α -thrombin,
20 Sigma Chemical Co. or Hematologic Technologies) in assay buffer, were
added, and the samples mixed. The final assay concentrations were: test
substance 0.00068 - 13.3 μ mol/L, S-2366 0.30 mmol/L, α -thrombin
0.020 NIHU/mL. The linear absorbance increment during 40 minutes
incubation at 37°C was used for calculation of percentage inhibition for
25 the test samples, as compared to blanks without inhibitor. The IC_{50} -
robotic value, corresponding to the inhibitor concentration which caused
50% inhibition of the thrombin activity, was calculated from a log
concentration vs. % inhibition curve.

Test C

Determination of the Inhibition Constant K_i for Human Thrombin

K_i -determinations were made using a chromogenic substrate method, performed at 37°C on a Cobas Bio centrifugal analyser (Roche, Basel, Switzerland). Residual enzyme activity after incubation of human α -thrombin with various concentrations of test compound was determined at three different substrate concentrations, and was measured as the change in optical absorbance at 405 nm.

Test compound solutions (100 μ L; normally in buffer or saline containing BSA 10 g/L) were mixed with 200 μ L of human α -thrombin (Sigma Chemical Co) in assay buffer (0.05 mol/L Tris-HCl pH 7.4, ionic strength 0.15 adjusted with NaCl) containing BSA (10 g/L), and analysed as samples in the Cobas Bio. A 60 μ L sample, together with 20 μ L of water, was added to 320 μ L of the substrate S-2238 (Chromogenix AB, Mölndal, Sweden) in assay buffer, and the absorbance change ($\Delta A/\text{min}$) was monitored. The final concentrations of S-2238 were 16, 24 and 50 μ mol/L and of thrombin 0.125 NIH U/mL.

The steady state reaction rate was used to construct Dixon plots, i.e. diagrams of inhibitor concentration vs. $1/(\Delta A/\text{min})$. For reversible, competitive inhibitors, the data points for the different substrate concentrations typically form straight lines which intercept at $x = -K_i$.

Test D

Determination of Activated Partial Thromboplastin Time (APTT)

APTT was determined in pooled normal human citrated plasma with the reagent PTT Automated 5 manufactured by Stago. The inhibitors were added to the plasma (10 μ L inhibitor solution to 90 μ L plasma) and

incubated with the APTT reagent for 3 minutes followed by the addition of 100 µL of calcium chloride solution (0.025 M) and APTT was determined by use of the coagulation analyser KC10 (Amelung) according to the instructions of the reagent producer.

5

The clotting time is expressed as absolute values (seconds) as well as the ratio of APTT without inhibitor (APTT₀) to APTT with inhibitor (APTT_i).

The latter ratios (range 1-0) were plotted against the concentration of inhibitor (log transformed) and fitted to sigmoidal dose-response curves

10 according to the equation

$$y = a/[1+(x/IC_{50})^s]$$

where: a = maximum range, i.e. 1; s = slope of the dose-response curve; and IC₅₀ = the concentration of inhibitor that doubles the clotting time.

The calculations were processed on a PC using the software program
15 GraFit Version 3, setting equation equal to: Start at 0, define end = 1 (Erithacus Software, Robin Leatherbarrow, Imperial College of Science, London, UK).

IC₅₀APTT is defined as the concentration of inhibitor in human plasma
20 that doubled the Activated Partial Thromboplastin Time.

Test E

Determination of Thrombin Time *ex vivo*

The inhibition of thrombin after oral or parenteral administration of the
25 compounds of formula I, dissolved in ethanol:Solutol™:water (5:5:90), were examined in conscious rats which, one or two days prior to the experiment, were equipped with a catheter for blood sampling from the carotid artery. On the experimental day blood samples were withdrawn at fixed times after the administration of the compound into plastic tubes

containing 1 part sodium citrate solution (0.13 mol per L) and 9 parts of blood. The tubes were centrifuged to obtain platelet poor plasma. The plasma was used for determination of thrombin time or ecarin clotting time (ECT) as described below.

5

The citrated rat plasma, 100 μ L, was diluted with a saline solution, 0.9%, 100 μ L, and plasma coagulation was started by the addition of human thrombin (T 6769, Sigma Chem Co, USA or Hematologic Technologies) in a buffer solution, pH 7.4, 100 μ L, or ecarin (Pentapharm). The
10 clotting time was measured in an automatic device (KC 10, Amelung, Germany).

Where a "prodrug" compound of formula I was administered, concentrations of the appropriate active thrombin inhibitor of formula I
15 (e.g. the free amidine compound) in the rat plasma were estimated by the use of standard curves relating the thrombin time or ecarin clotting time in the pooled citrated rat plasma to known concentrations of the corresponding "active" thrombin inhibitor dissolved in saline.

20 Based on the estimated plasma concentrations of the active thrombin inhibitor (which assumes that thrombin time or ECT prolongation is caused by the aforementioned compound) in the rat, the area under the curve after oral and/or parenteral administration of the corresponding prodrug compound of formula I was calculated (AUC_{pd}) using the
25 trapezoidal rule and extrapolation of data to infinity.

The bioavailability of the active thrombin inhibitor after oral or parenteral administration of the prodrug was calculated as below:

$$[(\text{AUC}_{\text{pd}}/\text{dose})/(\text{AUC}_{\text{active, parenteral}}/\text{dose})] \times 100$$

where $\text{AUC}_{\text{active, parenteral}}$ represents the AUC obtained after parenteral administration of the corresponding active thrombin inhibitor to conscious
5 rats as described above.

Test F

Determination of Thrombin Time in Urine *ex vivo*

The amount of the "active" thrombin inhibitor that was excreted in urine
10 after oral or parenteral administration of "prodrug" compounds of the invention, dissolved in ethanol:Solutol™:water (5:5:90), was estimated by determination of the thrombin time in urine *ex vivo* (assuming that thrombin time prolongation is caused by the aforementioned compound).

15 Conscious rats were placed in metabolism cages, allowing separate collection of urine and faeces, for 24 hours following oral administration of compounds of the invention. The thrombin time was determined on the collected urine as described below.

20 Pooled normal citrated human plasma (100 μL) was incubated with the concentrated rat urine, or saline dilutions thereof, for one minute. Plasma coagulation was then initiated by the administration of human thrombin (T 6769, Sigma Chem Company) in buffer solution (pH 7.4; 100 μL). The clotting time was measured in an automatic device (KC 10; Amelung).

25

The concentrations of the active thrombin inhibitor in the rat urine were estimated by the use of standard curves relating the thrombin time in the pooled normal citrated human plasma to known concentrations of the aforementioned active thrombin inhibitor dissolved in concentrated rat

urine (or saline dilutions thereof). By multiplying the total rat urine production over the 24 hour period with the estimated mean concentration of the aforementioned active inhibitor in the urine, the amount of the active inhibitor excreted in the urine (AMOUNT_{pd}) could be calculated.

5

The bioavailability of the active thrombin inhibitor after oral or parenteral administration of the prodrug was calculated as below:

$$[(\text{AMOUNT}_{\text{pd}}/\text{dose})/(\text{AMOUNT}_{\text{active,parenteral}}/\text{dose})] \times 100$$

10

where AMOUNT_{active,parenteral} represents the amount excreted in the urine after parenteral administration of the corresponding active thrombin inhibitor to conscious rats as described above.

15 Test G

Metabolic Activation of Prodrug Compounds *in vitro*

Prodrug compounds of formula I were incubated at 37°C with liver microsomes or 10 000 g (referring to the centrifuge speed) supernatant fractions (i.e. s9 fraction) prepared from human or rat liver homogenate.

- 20 The total protein concentration in the incubations were 1 or 3 mg/mL dissolved in 0.05 mol/L TRIS buffer (pH 7.4), and with the cofactors NADH (2.5 mmol/L) and NADPH (0.8 mmol/L) present. The total volume of the incubate was 1.2 mL. The initial prodrug concentrations were 5 or 10 µmol/L. Samples were collected from the incubate at
- 25 regular intervals more than 60 minutes after the start of the incubations. Samples (25 µL) from the incubate were mixed with an equal volume of human or rat plasma and an appropriate amount of thrombin, and the clotting time (i.e. thrombin time) was measured on a coagulometer (KC 10; Amelung). The amount of "active" thrombin inhibitor formed was

estimated by the use of standard curves relating the thrombin time in pooled citrated human or rat plasma to known concentrations of the corresponding "active thrombin inhibitor".

- 5 The amount of "active" thrombin inhibitor was alternatively, or in addition to the above-mentioned method, estimated by the use of LC-MS.

The solution was freeze dried to yield the hydrochloride salt which gave an $[\alpha]_D^{20}$ of -63.7° (c=1.0, MeOH). The enantiomeric excess was 97% as determined by analytical chiral HPLC.
